
Stuart Sutherland, Sutherland HDL, Inc.
Tom Fitzpatrick, Mentor Graphics Corporation
About the Authors

- **Stuart Sutherland**
  - Has been using Verilog since 1988
  - Involved in IEEE Verilog/SystemVerilog standards since inception
  - Technical editor of every generation of Verilog and SystemVerilog Language Reference Manuals
  - Author of books on Verilog, SystemVerilog and Verilog PLI

- **Tom Fitzpatrick**
  - Verification Technologist at Mentor Graphics Corp
  - 20+ of design and verification experience
  - Involved in the standardization of SystemVerilog
  - One of the original designers of AVM and OVM
  - Editor of Verification Horizons, a quarterly newsletter
  - Published articles and papers about verification methodologies
What We Will Discuss…

- A brief history of the evolution of Verilog and SystemVerilog
  - And why we need a 2012 version…
- Status of the proposed SystemVerilog-2012 standard
  - What has been done
  - When it will be available
- Overview of major new features
  - There’s a lot!
- Wrap-up and Q&A
  - Please jot down your questions and save them for Q&A at the end
A Brief History Lesson...

- **Verilog (IEEE standard 1364)**
  - Began in 1983 as a proprietary language
  - Opened to the public in 1992
  - **Between 1983 and 2005 design sizes increased dramatically!**

- **SystemVerilog (IEEE standard 1800)**
  - Originally intended to be the 2005 update to Verilog
  - Contains hundreds of enhancements and extensions to Verilog
  - Published in 2005 as a separate document
  - **Officially superseded Verilog in 2009**

For a summary of new features added in SV-2009, see the DAC-2009 2-part presentation by Stuart Sutherland and Cliff Cummings (available at www.sutherland-hdl.com and www.sunburst-design.com)
Mile High View of SystemVerilog-2012

- Design size and complexity continues to grow
  - And grow and grow…
- SystemVerilog is keeping pace (keeping up with Chip – your chip!)
  - IEEE began work on SV-2012 as soon as SV-2009 was complete
  - Work on specifying SV-2012 was finished in January 2012
  - IEEE balloting process began mid February 2012
- In a nut shell…
  - 31 new features added to the language
  - 60 clarifications to existing language features
  - 71 corrections (typos, English grammar, punctuation, etc.)
  - Dozens of minor editorial corrections (font usage, punctuation)

The focus of this paper is on the 31 new language features, and how those features can help make writing complex verification testbenches simpler or more efficient
Typed new() Constructors

Before...
- The object handle type and the new() type must be identical
- To create a child object and assign to a parent handle took 3 steps

### Example

```verilog
class base_trans; ... endclass

class reset_trans extends base_trans; ... endclass

base_trans t_base;
reset_trans t_reset t_reset = new;
t_base = t_reset;
```

### SystemVerilog-2012
- The call to new() can be “typed” using its class name
  - The return must be assigned to a handle of the same class type or a parent/grandparent of that type

```verilog
base_trans t_base = reset_trans::new;
```

- Fewer lines of code
- Self-documenting code
- Less risk of obscure errors
Nonblocking Assignments to Class Properties

- Before…
  - Class properties could not be assigned using nonblocking assigns
    - Nonblocking assignments are useful in verification code
    - Can prevent race conditions between the testbench and the DUT
  - SystemVerilog-2012
    - Removes the restriction about using nonblocking assignments
    - Allows verification engineers to take full advantage of SystemVerilog’s event scheduling rules

```verilog
class base_trans;
  int data;
  bit resetN;
endclass

initial begin
  t.resetN <= 0; // assert reset in NBA event region
  ...
```

Nonblocking assignment used to ensure DUT won’t miss a power-up reset
Multiple Inheritance

This is BIG!

- Before…
  - A class could only be extended from a single parent
    - Can require a more awkward, difficult to re-use coding style
- SystemVerilog-2012
  - Allows a child class to inherit from more than one parent class
  - Uses Java-like interface classes to handle multiple inheritance

- An “interface” class can contain:
  - Parameter constants
  - User-defined types (typedefs)
  - Pure virtual method prototypes
- A regular class can “implement” one or more interface classes

```verilog
interface class Put;
  pure virtual function void put(int a);
endclass

interface class Get;
  pure virtual function int get();
endclass

class Fifo implements Put, Get;
... // implementations of inherited methods
endclass
```

The full paper discusses some ways this new feature might be useful for a UVM testbench.
Soft Constraints

Before...

- All randomization constraints were “hard” constraints
  - An error results if a constraint conflicts with another constraint

This is also a big enhancement!

Example:
- A transaction class has constraints, but a specific test requires a different constraint
- An error will occur if the specific constraint conflicts with the built-in constraint
- The verification engineer writing the test must write extra code to avoid potential conflicts

SystemVerilog-2012

- Constraints can be specified as “soft”
  - Ignored if conflicts with another constraint

```verilog
class Packet;
  rand int pkt_size;
  constraint size {soft pkt_size inside {32,1024};}
endclass
Packet p = new();
p.randomize with {pkt_size == 512;}
```

The `randomize with()` constraint takes precedence over the soft constraint, instead of resulting in a run-time error.
Uniqueness Constraints

Before…

- There was no simple way to specify constraints so that several variables — or all the members of an array — had different random values and none had the same value.

SystemVerilog-2012

- Adds a uniqueness constraint that where all variables in a list or an array receive unique values.

```verilog
class Transaction;
    rand int a, b, c;
    rand byte data_array[16];

    constraint c1 { unique {a,b,c}; }
    constraint c2 { unique {data_array}; }
endclass
```

Constraint c1 ensures that, when random values are generated, the values of a, b and c will be different.

Constraint c2 ensures that when random values are generated, every element of data_array will have a different value.
Parameterized Methods / Parameterized Types

- **Before…**
  - Module and class parameters could be redefined for each instance.
  - Task/function instances could not have different parameter values.
  - Required writing many versions of the same task or function.

- **SystemVerilog-2012**
  - Allows static class methods to be “specialized” with unique parameter values each time the method is used.

```verilog
virtual class C #(parameter DECODE_W, localparam ENCODE_W=$clog2(DECODE_W));
  static function [DECODE_W-1:0] decoder_f (input [ENCODE_W-1:0] EncodeIn);
  ...
endfunction
endclass

module test;
  decoder_1 = C#(4)::decoder_f(2'b11);
  decoder_2 = C#(8)::decoder_f(3'b100);
  ...
```

- **Mantis 696**
  - Redefine DECODE_W value for each instance of decoder_f method.
- **Mantis 1504**
  - Each instance of a parameterized user-defined type can be specialized in a similar way.

Strictly speaking, these are “clarifications” in the standard, not new features.
Explicit Untyped Arguments in let Macros

- **Before…**
  - Any untyped formal arguments in let macros had to be listed first
    - Not consistent with the syntax of property and sequence definitions

- **SystemVerilog-2012**
  - A let formal argument in any position can be specified as untyped
    - Consistent syntax with property and sequence definitions

```verilog
class OK(event clk, {untyped a} = assert ($stable(a, clk));
module test;
  logic [31:0] d;
  real r;
  bit clock;
  task do_something;
    OK(@(posedge clock), d) ... ;
    OK(@(negedge clock), r); ...
  endtask
endmodule
```

Formal argument “\(a\)” is untyped, and takes on the type of the value passed in to it.
Var Type() in For-Loops / Ref Args with Dynamic Arrays

- Before…
  - The data type of a for-loop iterator had to be hard-coded
- SystemVerilog-2012
  - The `type()` function can be used to declare the iterator variable

```
parameter SIZE=64;
logic [SIZE-1:0] a, b;

for (var type({a,b}) i; i<=255; i++) ...
```

- If `SIZE` is not redefined, `i` will be declared as a logic [128:0] type
- If `SIZE` is redefined, variable `i` will adjust accordingly

- Before…
  - A task/function ref argument could only point to fixed-sized arrays
- SystemVerilog-2012
  - Adds ability for ref arguments to point to dynamically-sized arrays

```
task put_data (input value, ref d[$]);
d.push_back(value);
endtask

int data_q[$];
always @(posedge clock)
  put_data(data, data_q);
```

pass a queue to a task
$countbits System Function / `begin_keywords 1800-2012

- Before…
  - The $countones function returned the number of bits set to 1
  - There was no easy way to count the number of bits set to 0, X or Z
- SystemVerilog-2012
  - Adds a $countbits function that returns the number of bits set to a list of values

```verilog
$error("data has %0d bits with X or Z", $countbits (data, 'x, 'z) );
```

- Before…
  - The words implements, interconnect, nettype, and soft had no special meaning in the language
- SystemVerilog-2012
  - Reserves these four words as keywords
  - Adds an 1800-2012 argument to the `begin_keywords directive

Existing code that uses any of these new keywords should specify `begin_keywords 1800-2009
User-Defined Net Types / Typeless Netlists

These new features are important for mixed signal designs!

Before…

- Engineers could only create user-defined types based on variables

SystemVerilog-2012

- Adds ability to create user-defined net types based on net types
  - Can define custom nets for 2-state and floating point values
  - Can define custom resolution functions for multi-driver logic

Before…

- Netlists had to be hardcoded to only use specific net types

SystemVerilog-2012

- Adds a generic net that infers its type from lower-level connections
  - Enables using configurations to select design versions (e.g. digital or analog versions of a module) without modifying the netlist

These new features are important for mixed signal designs!
Coverpoint Variables / bins...with() Construct / Coverage Functions

- Before...
  - Coverpoint labels could not be used in expressions
  - Coverage expressions could not call functions
  - Coverage bins could not easily exclude specific values

- SystemVerilog-2012
  - Coverpoint labels are variables that can be used in expressions
  - Coverage expressions can call functions (eliminates duplicate code used by multiple coverpoints)
  - A bins...with() construct can be used to exclude values in a bin that would not be of interest in a test

```verilog
a: coverpoint data {
  bins mod16[] = {[0:255]} with (item % 16 == 0);
}
```

mod16 only tracks values that are evenly divisible by 16
(“item” is a variable that is built into bins...with() )
Assertion Data Types / Sampled Value Data Types

- Before…
  - Assertions were limited to testing simple, integral values

- SystemVerilog-2012
  - Assertions can now test real (floating point) values and dynamic arrays (such as strings and queues) and static class properties

- Before…
  - Value sampling functions, such as $sample() were limited to testing simple, integral values

- SystemVerilog-2012
  - Value sampling functions can now test real values and dynamic arrays (e.g.: strings and queues) and static class properties

```verilog
byte q[$];
property p1;
  $rose(write) |-> q[0];
endproperty
```

A dynamic queue array

---

Mantis 2328
Mantis 2353
Mantis 3213
Global Clock Resolution

Before…

- There could only be a single global clock definition, which encompassed the entire design
  - Made it difficult to verify designs with multiple clock domains

SystemVerilog-2012

- Each hierarchy scope can have a different global clock
  - Applies to all sub-scopes until a new global clock is defined

```verilog
class master (...);
...
global clocking @(posedge m_clock);
endclocking
...
property @$global_clock
...
endproperty
...
endmodule

module slave (...);
...
global clocking @(posedge s_clock);
endclocking
...
property @$global_clock
...
endproperty
...
endmodule
```

NOTE: This enhancement is not backward compatible with SystemVerilog-2009
Inferred Clocks in Sequences / Sequence Method Expressions

Before…
- An assertion sequence only infers a clock when used in a property
- SystemVerilog-2012
  - Sequences can infer a clock in other contexts

Before…
- The triggered and matched sequence methods could only be used on instances of a sequence
- SystemVerilog-2012
  - Sequence methods can also be used with a sequence expression

```verilog
checker check_mutex(input sequence s1, input cond, event clk=$inferred_clock);
    default clocking cb @clk; endclocking
    let r = s1.triggered;
    a1: assert property (cond |=> r);
endchecker
```

Not allowed in SV-2009
Final Deferred Immediate Assertions

Before...

- **Immediate assertions** can have glitches within a moment in time.
- SystemVerilog-2009’s *deferred immediate assertions* reduce the risk of glitches but do not eliminate them.

```verilog
always_comb
  A2: assert #0 (!$isunknown state) else begin
      err_cnt++;
      $error("bad state");
  end
```

- Processed in the **Reactive event region**
- Can execute any type of programming statements

**SystemVerilog-2012**

- Adds **final deferred immediate assertions** that eliminate all glitches.

```verilog
always_comb
  A3: assert final (!$isunknown state)
      else $error("bad state");
```

- Processed in the **Postponed event region**
- Can only execute a single print statement
- Cannot contain `begin...end`
Fine-grained Assertion Control

Before...

- Could only control assertions with a medium level of granularity using $assertkill, $assertoff, and $asserton system tasks
  - Could specify a specific assertion or a specific hierarchy scope
  - Could not distinguish assert, assume, cover, expect assertions
  - Could not distinguish concurrent vs. immediate assertions
  - Could not lock out specific assertions from global controls

SystemVerilog-2012

- Adds a new $assertcontrol system task that provides the fine level of control granularity not possible before

```plaintext
eenum { LOCK=1, UNLOCK=2, ON=3, OFF=4, KILL=5,
      CONCURRENT=1, IMMEDIATE=2, D_IMMEDIATE=12,
      EXPECT=16, ASSERT=1, COVER=2, ASSUME=4
    } controls;

$assertcontrol(OFF, CONCURRENT, COVER|ASSUME, 0);
```

Mantis 3295
Checker Output Arguments / More Checker Programming

- **Before…**
  - A checker could instantiate other checkers, but checkers could only have input arguments
    - Limited ability to build up complex checkers from other checkers
  - **SystemVerilog-2012**
    - Checkers can have output arguments, similar to tasks or modules

- **Before…**
  - Checkers supported a very limited set of programming statements
  - **SystemVerilog-2012**
    - Checkers now support:
      - `always_comb`, `always_latch`, `always_ff`
      - Blocking assignments
      - Conditional statements
      - Looping statements
      - Immediate assertions
      - Task calls
      - `let` declarations
      - Continuous assignment of checker variables

**NOTE:** This enhancement is not backward compatible with SV-2009 (*always* within `let` now illegal)
VPI Enhancements

- Before…
  - The SystemVerilog Verification Procedural Interface (VPI) supported constructs in the SystemVerilog-2009 standard

- SystemVerilog-2012
  - The VPI was enhanced to support the new features added in SystemVerilog-2012
    - VPI support for soft constraints
    - VPI access added to the built-in process class
    - VPI transition to typespecs added to named events
    - VPI join type property added to the Scope diagram
  - Many other minor enhancements and clarifications were made to the SystemVerilog-2012 VPI
Summary –
SystemVerilog-2012 adds **31 New Features**

- **OOP enhancements**
  - Typed new() constructors
  - Nonblocking assignments
  - Multiple inheritance

- **Constrained random enhancements**
  - Soft constraints
  - Uniqueness constraints

- **Programming enhancements**
  - Parameterized tasks and functions
  - Parameterized user-defined types
  - Untyped arguments in let constructs
  - var type() in for-loops
  - ref arguments with dynamic arrays
  - $countbits system function
  - `begin_keyword 1800-2012

- **Mixed-signal enhancements**
  - User-defined net types
  - Typeless netlist connections

- **Coverage enhancements**
  - Coverpoint variables
  - bins…with() expressions
  - Coverage functions

- **Assertion enhancements**
  - More assertion data types
  - More sampled value data types
  - Testing static class properties
  - Global clock redefined
  - Inferred clocks in sequences
  - Sequence method expressions
  - Final deferred immediate assertions
  - Fine-grained assertion control

- **Checker enhancements**
  - Checker Output Arguments
  - More Checker Programming

- **VPI enhancements**
  - 4+ extensions to support new features

**SystemVerilog-2012 is in the process of being approved by the IEEE**
**EDA vendors are already implementing these new features!**
